Human Rights and Climate Change: 
The Way Forward to Sustainable Development

Human Rights Council Seminar
“Addressing the Adverse Effects of Climate Change on the
Full Enjoyment of Human Rights”

Vicente Paolo Yu III

24 February 2012
Geneva
The linkage has long been recognized from 1972 to the present.

How do we operationalize this linkage?
Why Equity is Important in Addressing Climate Change and Sustainable Development

2005 GDP-CO2eq per Capita Matrix

[Graph showing the relationship between 2005 GHG Emissions (CO2eq Ton Per Capita) and GDP-CO2eq per Capita for different categories: Developing Countries, Economies in Transition, OECD + EU27, Global Average]
Stabilization is needed for human society to survive and human rights to be respected

• 2C – the dividing line between dangerous and catastrophic (irreversible) climate change. We are now at around 0.7C above pre-industrial levels, with already serious adverse effects on developing countries, and most likely will exceed 2C at current levels of mitigation ambition from developed and developing countries

• All countries must contribute equitably under the UNFCCC to achieving the global objective of stabilization of GHG atmospheric concentrations below dangerous levels within a timeframe that allows for natural ecosystem adaptation, food security, and sustainable development
Equity and Sustainable Development in the Context of Climate Change

Emission reductions

- Global carbon budget (2010-2050)
  - Annex I carbon share
    - Developed countries to take the lead in cutting emissions
      (existing UNFCCC obligation)
  - Non-Annex I carbon share
    - Bending emissions growth downward while keeping economic growth curve upward

Finance and Technology

- GHG concentrations in the atmosphere
- Global temperature increase
- Regional temperature increase

Adaptation

- Adaptation impacts, costs and actions in developing countries in context of sustainable development

Mitigation costs and actions in developing countries in context of sustainable development

Developed countries provide finance, technology transfer to developing countries to support mitigation and adaptation actions in context of sustainable development (existing UNFCCC obligations)

Finance

Technology
Assuming:
- 50% global cut and 80% Annex 1 cut by 2050 relative to 1990
- UN-projected population growth to 2050
- Using IPCC SRES 2000 emission projections to 2050

</tbody>
</table>

Required calculated deviation for developing countries based more recent BAU emission projection studies would be even steeper – e.g. **-83%** from BAU under IEA WEO 2009 projections; **-94%** from BAU under 2008 Garnaut Review.
### Defining Global Peak Year Defines When Developing Countries Peak

Economic Implications of Emission Cuts for Developing Countries

Historically, in the period 1990 to 2005, per capita GDP-emissions correlation for developing countries was 0.74

1% GDP per capita growth = 0.74% emissions per capita growth

Assuming:
• Historical per capita GDP and emission growth rates from 1990 to 2005 and correlation for developing countries
• Current levels of energy technology in developing countries
• High financing requirements of developing countries for mitigation and adaptation, but without adequate technology transfer and financing being provided to developing countries (as is currently the case and seems likely to be the case despite Cancun and Durban decisions re technology transfer and GCF)

Imposing limits to developing countries’ per capita emissions growth could mean imposing limits to developing countries’ GDP per capita growth
Human Rights and Climate Change:
Ensuring Human Rights and Climate Adaptation through Sustainable Development

• Human rights protection, effective climate adaptation, and increased climate resilience can be best ensured through achievement of sustainable development.

• Achieve the right to sustainable development in the context of climate change by linking of 1972 Stockholm Declaration principles, 1986 RTD Declaration, 1992 Rio Declaration principles, through effective implementation of UNFCCC, ensuring human rights are protected in the process and reflecting equity and common but differentiated responsibilities and respective capabilities.
Human Rights and Climate Change: Ensuring Human Rights and Climate Adaptation through Sustainable Development

• There is continuing need for international solidarity and cooperation under UNFCCC:
  
  • **Developed countries take the lead in higher mitigation ambition** – to change long-term trends including in changing consumption patterns
  • **Developing countries to contribute to mitigation appropriately in the context of their sustainable development** priorities and circumstances (including macroeconomic development and industrial policy goals and objectives), to be supported by:
    • **Climate financing from developed countries** at scales more than $30B from 2010-2012 and up to $100B/yr by 2020 – e.g. UNDESA WESS 2011 estimated US$1.1 Trillion/year for investments in mitigation, adaptation, food security, sustainable development in developing countries from 2010 to 2050 (less than the annual cost of military expenditures from 2002-2010, or the total bailouts from the 2008 financial crisis)
    • **Technology transfer from developed countries** (including financing) – for technology infrastructure shift and endogenous technology development (facilitative mechanisms and elimination of barriers)
    • **Adaptation support from developed countries** for developing countries linked to development objectives
    • **Developing an enabling and supportive international policy environment** – coherent approaches to international trade, finance, intellectual property, ODA policies to support sustainable development in developing countries
